Mims

The online solution to inventory management

far edge Technology

- Do you need to manage the movement of inventory between multiple locations, and third parties?

- Do you need to be able to see the location of stock in real time?
- Do your partners need access to your system to request stock?
- Do you need to track the quality of stock?

The Multi-Site Inventory Management System (Mims), developed in Australia by Far Edge Pty Ltd, is the definitive online tool to help you manage stock over multiple locations through an easy to use, highly-configurable application.

Comprehensive Product Management

Mims provides a comprehensive product management interface. Details about products can be maintained including pricing, warranty classification, product types, model types, and identification numbers. Price changes are tracked over time to allow reporting on stock depreciation.

Know Your Position

Logistics staff require convenient access at all times to the movements of stock. If an item is in transit, they need to be able to determine quickly which parties are involved. Has the stock been received? What movements of stock account for the current in-hand quantity? Mims makes such information readily available to logistics staff and third parties, wherever they are located.

Mims employs a hierarchical location management system, to allow multiple stores within a company. Rights can be assigned to users on the basis of locations, to allow multiple companies to simultaneously and safely access stock and transfer information.

Complete User Management

Managing users is made easy through our comprehensive role-based permission model. Define roles for users, and specify all relevant workflows and locations. Such a model allows you to integrate management of third-party stock in the value-chain, without compromising the security of sensitive internal stock quantities.

Internally, Mims employs a robust security model that centralises security decisions at the database layer to ensure consistent and secure system performance.

Mims is a reliable, cost effective investment where quality of information and security are paramount concerns. With a dedicated team of expert system administrators, business analysts and developers, Far Edge can close the gap to provide a complete stock management solution for your business.

Status and Grading Support

Mims has the capacity to maintain stock levels at configurable statuses, such as complete, faulty and incomplete. Existing stock grading processes are supported by Mims, and movements between statuses fully auditable, making Mims suitable for businesses processing returned or differentiated stock.

Audit Trail

All transactions in Mims are recorded in an audit trail, allowing the integrity of the system to be verified automatically using integrated tools. Explanatory drill-down facilities on items allow stock movements to be justified by the balance of transfers in and out of a location.

Stay Connected

Third parties can connect to Mims using a variety of transfer protocols. Mims allows order notification via XML and email, with a modular structure allowing custom protocols on request. Communications along the value chain are simplified through an automated notification workflow, meaning fewer phone calls.

Close the 10% Gap

Not all businesses operate in the same way. For this reason, Mims has been engineered from the ground up to facilitate new customer needs, using proprietary application generator tools that reduce the development cycle for any required enhancements. Data and key transaction logic is centralised in Microsoft SQL Server, to make integration with reporting, third-party tools, and workflow engines easy.

Monitor and Report

Customised reports are easy to generate, and can be delivered by a variety of tools including Business Objects, Crystal Reports, MS Access, Excel or via ODBC to other systems. We provide a set of Crystal XI reports for most commonly requested information, and can easily build others to meet your requirements.
